HIROSHI SAKURAI

Electronic products, large and small, such as AC adapters, home electric appliances and electric cars, use power semiconductor devices. Power devices are used for power conversion: inverters change direct current into alternating current and converters change alternating current into direct current. Electronic products are becoming increasingly energy-savings oriented, and there is growing demand for high-quality and low-cost power devices. There is cutthroat competition for the development of such power devices among companies both at home and abroad.

One of the major problems for power device developers is how to reduce electric power loss. For current power devices, electric power is lost in the conversion between direct current and alternating current. Electrical goods, such as AC adaptors or computers, A new power semiconductor device using gallium oxide to achieve less electric power loss has been developed. The innovation is expected to greatly contribute to the energy-saving and miniaturization of electronic products.

“Sophia” Wisdom for Reducing Electric Power Loss

Because this method does not need an expensive vacuum device, unlike in conventional semiconductor manufacturing, production costs can be reduced to a tenth of those for silicon carbide-made power devices. Moreover, the method does not use environment-polluting substances like cyanide, so it has the additional benefit of being environmentally friendly.

FLOSFIA created an $\alpha$-Ga$_2$O$_3$ power device in 2016 that reduced electric power loss significantly over silicon-made power devices manufactured by other companies. FLOSFIA expects that their power devices will be soon installed in AC adaptors and home electronics, as well as in industrial devices, such as robots and X-ray equipment, from 2020.

FLOSFIA's technology has attracted the attention of major companies. In 2018, FLOSFIA announced that it would start jointly developing low-power-loss, low-cost, miniaturized, light-weight power devices for hybrid and electric cars with automobile parts manufacturers, aiming to bring them to market by 2025. The use of power devices with reduced electric power loss will extend the mileage and reduce vehicle body weight.

Hitora says, “I believe that $\alpha$-Ga$_2$O$_3$ power devices have the potential to have a huge impact on industry. Our goal is to produce devices that meet public demand and contribute to creating a new industry.”

FLOSFIA's name represents the company's goal to put the polish on the "flow" of "sophia" wisdom and to flow it back into society, thereby contributing to the progress of humankind. The company is just taking the first steps now.
